This is part of the online course Proteomics Data Analysis (PDA)

• Playlist PDA Preprocessing

Outline

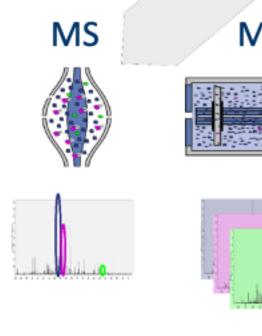

- 1. Introduction
- 2. Preprocessing
 - Log-transformation
 - Filtering
 - Normalization
 - Summarization

Note, that the R-code is included for learners who are aiming to develop R/markdown scripts to automate their quantitative proteomics data analyses. According to the target audience of the course we either work with a graphical user interface (GUI) in a R/shiny App msqrob2gui (e.g. Proteomics Bioinformatics course of the EBI and the Proteomics Data Analysis course at the Gulbenkian institute) or with R/markdowns scripts (e.g. Bioinformatics Summer School at UCLouvain or the Statistical Genomics Course at Ghent University).

1 Intro: Challenges in Label-Free Quantitative Proteomics

1.1 MS-based workflow

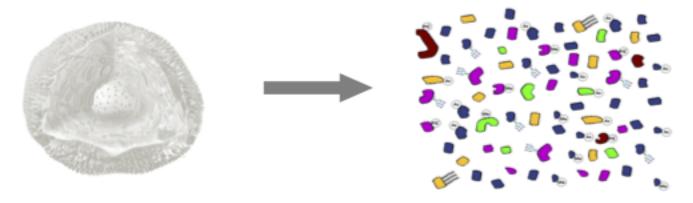

Quantification Ident

- Peptide Characteristics
 - Modifications
 - Ionisation Efficiency: huge variability
 - Identification

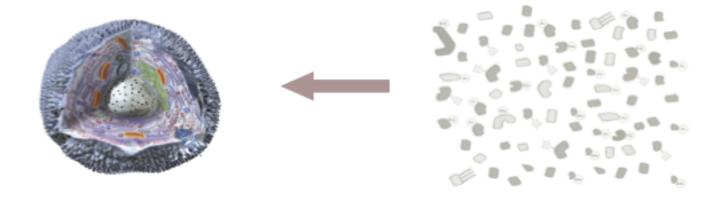

- * Misidentification \rightarrow outliers
- $\ast~\mathrm{MS^2}$ selection on peptide abundance
- * Context depending missingness
- * Non-random missingness
- \rightarrow Unbalanced pepide identifications across samples and messy data

1.2 Level of quantification

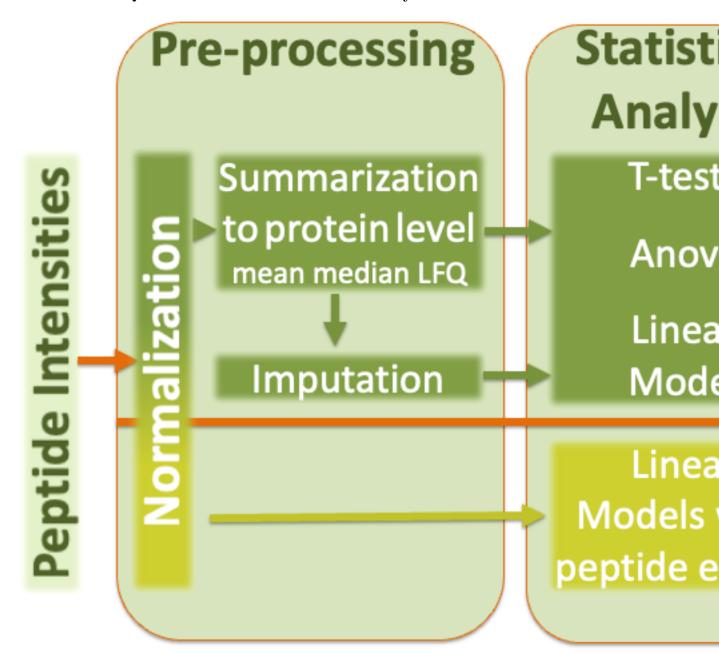

• MS-based proteomics returns peptides: pieces of proteins

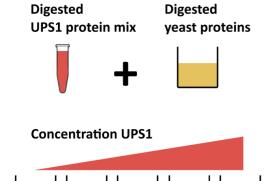

• Quantification commonly required on the protein level

1.3 Label-free Quantitative Proteomics Data Analysis Workflows

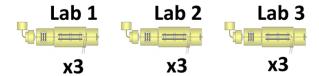

1.4 CPTAC Spike-in Study

5 spike-in concentrations: 6A to 6E

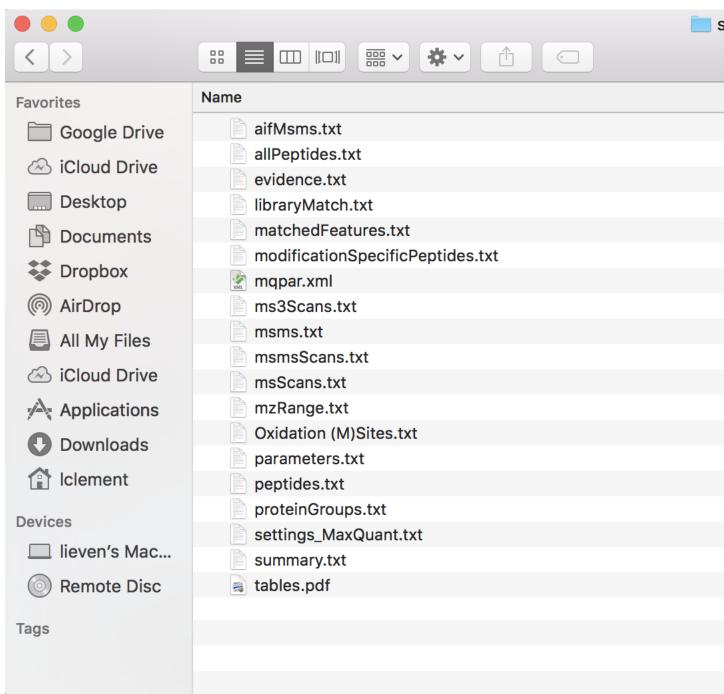

6C

6A

- Same trypsin-digested yeast proteome background in each sample
- Trypsin-digested Sigma UPS1 standard: 48 different human proteins spiked in at 5 different concentrations (treatment A-E)
- Samples repeatedly run on different instruments in different labs
- $\bullet\,$ After MaxQuant search with match between runs option
 - 41% of all proteins are quantified in all samples
 - 6.6% of all peptides are quantified in all samples
- \rightarrow vast amount of missingness

1.5 Maxquant output

2 Import the data in R

2.1 Data infrastructure

Click to see background on data infrastructure used in R to store proteomics data

• We use the QFeatures package that provides the infrastructure to

- store,
- process,
- manipulate and
- analyse quantitative data/features from mass spectrometry experiments.
- It is based on the SummarizedExperiment and MultiAssayExperiment classes.
- Assays in a QFeatures object have a hierarchical relation:
 - proteins are composed of peptides,
 - themselves produced by spectra
 - relations between assays are tracked and recorded throughout data processing

2.2 Import data in R

2.2.1 Load libraries

Click to see code

```
library(tidyverse)
library(limma)
library(QFeatures)
library(msqrob2)
library(plotly)
library(ggplot2)
```

2.2.2 Read data

Click to see background and code

1. We use a peptides.txt file from MS-data quantified with maxquant that contains MS1 intensities summarized at the peptide level.

peptidesFile <- "https://raw.githubusercontent.com/statOmics/PDA22GTPB/data/quantification/fullCptacDat</pre>

2. Maxquant stores the intensity data for the different samples in columns that start with Intensity. We can retreive the column names with the intensity data with the code below:

```
ecols <- grep("Intensity\\.", names(read.delim(peptidesFile)))</pre>
```

3. Read the data and store it in QFeatures object

```
pe <- readQFeatures(
   assayData = read.delim(peptidesFile),
   fnames = 1,
   quantCols = ecols,
   name = "peptideRaw")</pre>
```

- ## Checking arguments.
- ## Loading data as a 'SummarizedExperiment' object.
- ## Formatting sample annotations (colData).
- ## Formatting data as a 'QFeatures' object.

2.2.3 Explore object

Click to see background and code

• The rowData contains information on the features (peptides) in the assay. E.g. Sequence, protein, ...

22/06/2021 SE.svg

file: ///Users/lclement/Dropbox/statOmics/PDA21/figures/SE.svg

1/1

Figure 1: Conceptual representation of a 'SummarizedExperiment' object. Assays contain information on the measured omics features (rows) for different samples (columns). The 'rowData' contains information on the omics features, the 'colData' contains information on the samples, i.e. experimental design etc.

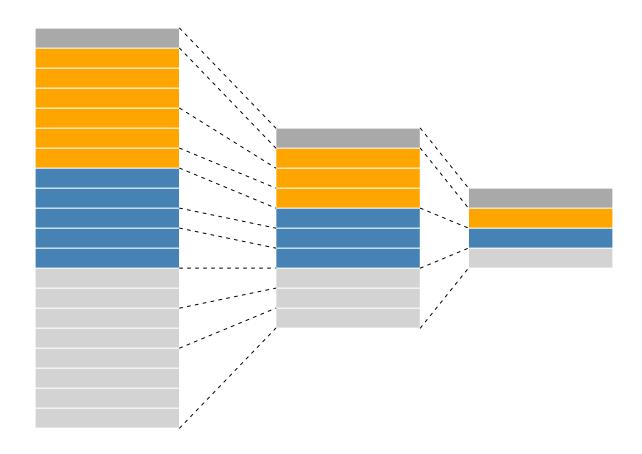

Figure 2: Conceptual representation of a ${\tt QFeatures}$ object and the aggregative relation between different assays.

rowData(pe[["peptideRaw"]])

3 Preprocessing

3.1 Log-transformation

3.1.1 Explore the data with plots

Peptide AALEELVK from spiked-in UPS protein P12081. We only show data from lab1.

Click to see code to make plot

plotWhyLog

peptide AALEELVK in lab1

- Variance increases with the mean \rightarrow Multiplicative error structure

Click to see code to make plot

plotLog

peptide AALEELVK in lab1 with axes on log scale

- Data seems to be homoscedastic on log-scale \rightarrow log transformation of the intensity data
- In quantitative proteomics analysis on log₂
- \rightarrow Differences on a \log_2 scale: \log_2 fold changes

$$\log_2 B - \log_2 A = \log_2 \frac{B}{A} = \log F C_{\text{B - A}}$$

$$log_2 FC = 1 \rightarrow FC = 2^1 = 2$$

$$log_2 FC = 2 \rightarrow FC = 2^2 = 4$$

3.1.2 log-transformation of the data

Click to see code to log-transfrom the data

- We calculate how many non zero intensities we have for each peptide and this can be useful for filtering.
 rowData(pe[["peptideRaw"]]) \$nNonZero <- rowSums(assay(pe[["peptideRaw"]]) > 0)
 - \bullet Peptides with zero intensities are missing peptides and should be represent with a NA value rather than 0.

pe <- zeroIsNA(pe, "peptideRaw") # convert 0 to NA

• Logtransform data with base 2

pe <- logTransform(pe, base = 2, i = "peptideRaw", name = "peptideLog")</pre>

3.2 Filtering

- Reverse sequences
- Only identified by modification site (only modified peptides detected)
- Razor peptides: non-unique peptides assigned to the protein group with the most other peptides
- Contaminants
- Peptides few identifications
- Proteins that are only identified with one or a few peptides

Filtering does not induce bias if the criterion is independent from the downstream data analysis!

Click to see code to filter the data

1. Handling overlapping protein groups

In our approach a peptide can map to multiple proteins, as long as there is none of these proteins present in a smaller subgroup.

```
pe <- filterFeatures(pe, ~ Proteins %in% smallestUniqueGroups(rowData(pe[["peptideLog"]])$Proteins))</pre>
```

- ## 'Proteins' found in 2 out of 2 assay(s)
 - 2. Remove reverse sequences (decoys) and contaminants

We now remove the contaminants, peptides that map to decoy sequences, and proteins which were only identified by peptides with modifications.

```
pe <- filterFeatures(pe,~Reverse != "+")
## 'Reverse' found in 2 out of 2 assay(s)
pe <- filterFeatures(pe,~ Potential.contaminant != "+")</pre>
```

- ## 'Potential.contaminant' found in 2 out of 2 assay(s)
 - 3. Drop peptides that were only identified in one sample

We keep peptides that were observed at last twice.

```
pe <- filterFeatures(pe,~ nNonZero >=2)
## 'nNonZero' found in 2 out of 2 assay(s)
nrow(pe[["peptideLog"]])
```

[1] 10478

We keep 10478 peptides upon filtering.

3.3 Normalization

Click to see code to make plot

```
densityConditionD <- pe[["peptideLog"]][,colData(pe)$condition=="D"] %>%
   assay %>%
   as.data.frame() %>%
   gather(sample, intensity) %>%
   mutate(lab = colData(pe)[sample,"lab"]) %>%
   ggplot(aes(x=intensity,group=sample,color=lab)) +
```

```
geom_density() +
    ggtitle("condition D")

densityLab2 <- pe[["peptideLog"]][,colData(pe)$lab=="lab2"] %>%
    assay %>%
    as.data.frame() %>%
    gather(sample, intensity) %>%
    mutate(condition = colData(pe)[sample,"condition"]) %>%
    ggplot(aes(x=intensity,group=sample,color=condition)) +
        geom_density() +
        ggtitle("lab2")
```

${\tt densityConditionD}$

 $\mbox{\tt \#\#}$ Warning: Removed 39179 rows containing non-finite outside the scale range $\mbox{\tt \#\#}$ (`stat_density()`).

condition D

densityLab2

Warning: Removed 44480 rows containing non-finite outside the scale range
(`stat_density()`).

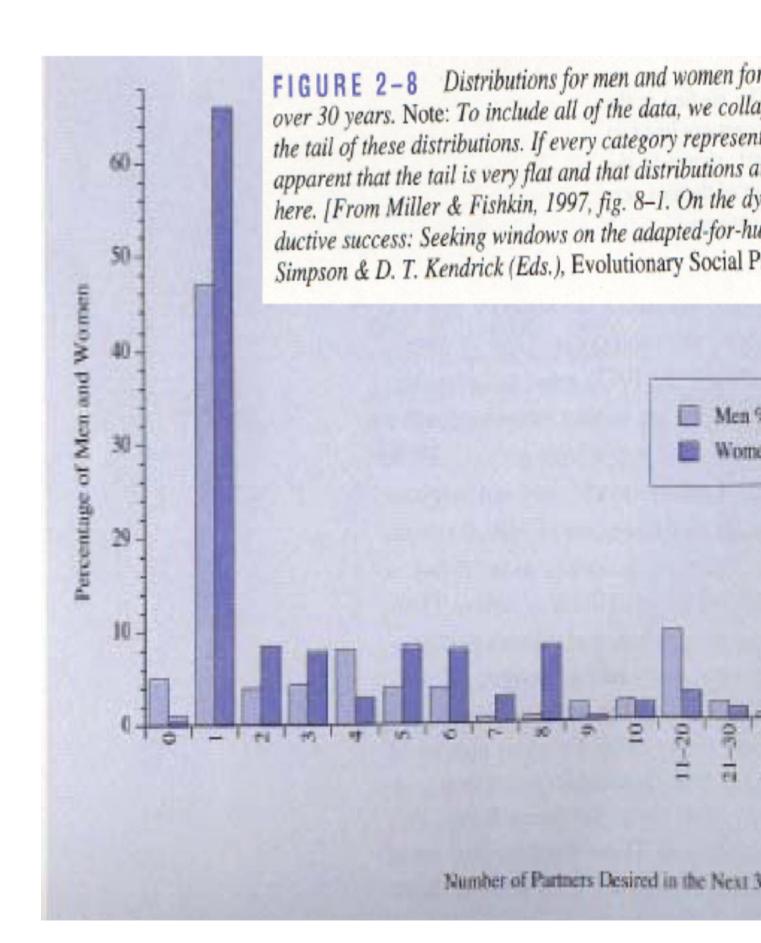

- Even in very clean synthetic dataset (same background, only 48 UPS proteins can be different) the marginal peptide intensity distribution across samples can be quite distinct
 - Considerable effects between and within labs for replicate samples
 - Considerable effects between samples with different spike-in concentration
- \rightarrow Normalization is needed

3.3.1 Mean or median?

- Miller and Fishkin (1997) reported that over a period of 30 years males would like to have on average 64.3 partners and females 2.8.
- Miller and Fishkin (1997) reported that the median number of partners someone would like to have over a period of 30 years males is 1 for both males and females.

Mean is very sensitive to outliers!

3.3.2 Normalization of the data by median centering

$$y_{ip}^{\text{norm}} = y_{ip} - \hat{\mu}_i$$

with $\hat{\mu}_i$ the median intensity over all observed peptides in sample i.

Click to see R-code to normalize the data

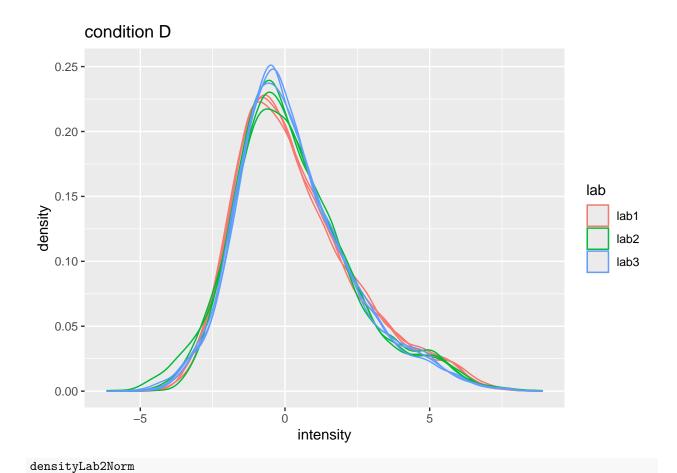

3.3.3 Plots of normalized data

Click to see code to make plot

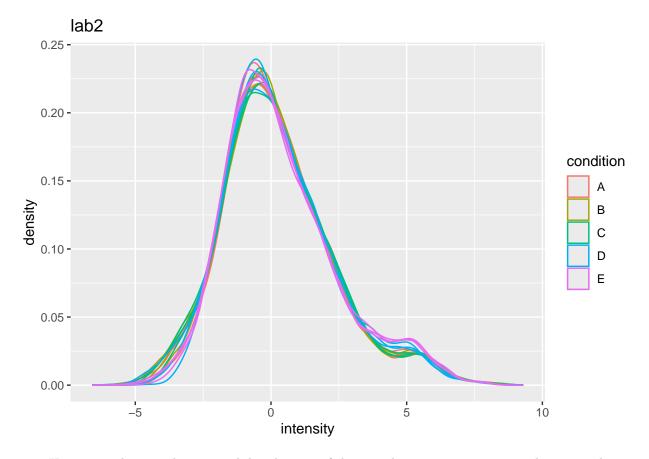

```
densityConditionDNorm <- pe[["peptideNorm"]][,colData(pe)$condition=="D"] %>%
  assay %>%
  as.data.frame() %>%
  gather(sample, intensity) %>%
  mutate(lab = colData(pe)[sample,"lab"]) %>%
  ggplot(aes(x=intensity,group=sample,color=lab)) +
   geom_density() +
   ggtitle("condition D")
densityLab2Norm <- pe[["peptideNorm"]][,colData(pe)$lab=="lab2"] %>%
  assay %>%
  as.data.frame() %>%
  gather(sample, intensity) %>%
  mutate(condition = colData(pe)[sample, "condition"]) %>%
  ggplot(aes(x=intensity,group=sample,color=condition)) +
   geom_density() +
   ggtitle("lab2")
```

densityConditionDNorm

```
## Warning: Removed 39179 rows containing non-finite outside the scale range
## (`stat_density()`).
```

Warning: Removed 44480 rows containing non-finite outside the scale range ## (`stat_density()`).

- Upon normalization the marginal distributions of the peptide intensities across samples are much more comparable
- We still see deviations
- This can be due to technical variability
- In micro-array literature, quantile normalisation is used to force the median and all other quantiles to be equal across samples
- In proteomics quantile normalisation often introduces artifacts due to a difference in missing peptides across samples
- More advanced methods should be developed for normalizing proteomics data
- If there are differences in the width of the marginal distributions of the data across samples. They can also be standardized by using a robust estimator for location and scale, i.e.

$$y_{ip}^{\text{norm}} = \frac{y_{ip} - \mu_i}{s_i}$$

3.4 Summarization

• We illustrate summarization issues using a subset of the cptac study (Lab 2, condition A and E) for a spiked protein (UPS P12081).

Click to see code to make plot

```
summaryPlot <- pe[["peptideNorm"]][
    rowData(pe[["peptideNorm"]])$Proteins == "P12081ups|SYHC_HUMAN_UPS",
    colData(pe)$lab=="lab2"&colData(pe)$condition %in% c("A","E")] %>%
    assay %>%
    as.data.frame %>%
```

```
rownames_to_column(var = "peptide") %>%
gather(sample, intensity, -peptide) %>%
mutate(condition = colData(pe)[sample, "condition"]) %>%
ggplot(aes(x = peptide, y = intensity, color = sample, group = sample, label = condition), show.legengeom_line(show.legend = FALSE) +
geom_text(show.legend = FALSE) +
theme_minimal() +
theme(axis.text.x = element_text(angle = 90, vjust = 0.5, hjust = 1)) +
xlab("Peptide") +
ylab("Intensity (log2)")
```

summaryPlot

Warning: Removed 10 rows containing missing values or values outside the scale range
(`geom_line()`).

Warning: Removed 90 rows containing missing values or values outside the scale range
(`geom_text()`).

We observe:

- intensities from multiple peptides for each protein in a sample
- Strong peptide effect -Unbalanced peptide identification
- Pseudo-replication: peptide intensities from a particular protein in the same sample are correlated, i.e. they more alike than peptide intensities from a particular protein between samples.
- \rightarrow Summarize all peptide intensities from the same protein in a sample into a single protein expression value Commonly used methods are

• Mean summarization

$$y_{ip} = \beta_i^{\text{samp}} + \epsilon_{ip}$$

- Median summarization
- Maxquant's maxLFQ summarization (in protein groups file)
- Model based summarization:

$$y_{ip} = \beta_i^{\text{samp}} + \beta_p^{\text{pep}} + \epsilon_{ip}$$

Click to see R-code to aggregate the data

We use the standard sumarization in aggregateFeatures, which is robust model based summarization.

```
pe <- aggregateFeatures(pe,
    i = "peptideNorm",
    fcol = "Proteins",
    na.rm = TRUE,
    name = "protein")</pre>
```

Your quantitative and row data contain missing values. Please read the ## relevant section(s) in the aggregateFeatures manual page regarding the ## effects of missing values on data aggregation.

Other summarization methods can be implemented by using the fun argument in the aggregateFeatures function.

- fun = MsCoreUtils::medianPolish() to fits an additive model (two way decomposition) using Tukey's median polish_ procedure using stats::medpolish()
- fun = MsCoreUtils::robustSummary() to calculate a robust aggregation using MASS::rlm() (default)
- fun = base::colMeans() to use the mean of each column
- fun = matrixStats::colMedians() to use the median of each column
- fun = base::colSums() to use the sum of each column

4 Exercise

- 1. We will evaluate different summarization methods (Maxquant maxLFQ, median and robust model based) in the tutorial session before discussing on their advantages/disadvantages.
- 2. Can you anticipate on potential problems related to the summarization?

5 Software & code

- Our R/Bioconductor package msqrob2 can be used in R markdown scripts or with a GUI/shinyApp in the msqrob2gui package.
- The GUI is intended as a introduction to the key concepts of proteomics data analysis for users who have no experience in R.
- However, learning how to code data analyses in R markdown scripts is key for open en reproducible science and for reporting your proteomics data analyses and interpretation in a reproducible way.

• More information on our tools can be found in our papers (L. J. Goeminne, Gevaert, and Clement 2016), (L. J. E. Goeminne et al. 2020) and (Sticker et al. 2020). Please refer to our work when using our tools.

5.1 Code

- 1. Data infrastructure
- 2. Import proteomics data
- 3. Preprocessing
 - Log-transformation
 - Filtering
 - Normalisation
 - Summarization

5.2 Data analysis with the GUI/shinyApp msqrob2gui
